EXPLANATIONS

REGARDING PRONUNCIATION AND CHEMICAL SYMBOLS.

PRONUNCIATION.

IN showing the pronunciation the simplest and most easily understood method has been adopted, that of *re-writing* the word in a different form. In doing so the same letter or combination of letters is made use of for the same *sound*, no matter by what letter or letters the sound may be expressed in the principal word. The *key* by this means is greatly simplified, the reader having only to bear in mind one mark for each sound.

Vowels.

a, as in fate.	o, as in not.
ä, " fat.	ö, " move.
ä, " fat.	ü, " tube.
ä, " fall.	u, " tub.
e, " me.	ü, " bull.
e, " met.	ü, " Sc. abune (Fr. u).
é, " her.	oi, " oil.
i, " pine.	ou, " pound.
i, " pin.	y, " Sc. fey (=e+i).
ö, " note.	

Consonants.

ch, .. as in .. chain.	th, as in then.
ch, .. " .. Sc. loch, Ger. nacht.	th, " thin.
j, .. " .. job.	w, " wig.
g, .. " .. go.	wh, " whig.
h, .. " .. Fr. ton.	zh, " azure.
ng, .. " .. sing.	

The application of this key to the pronunciation of foreign words can as a rule only represent approximately the true pronunciation of those words. It is applicable, however, to Latin and Greek words, as those languages are pronounced in England.

Accent.—Words consisting of more than one syllable receive an accent, as the first syllable of the word *labour*, the second of *delay*, and the third of *comprehension*. The accented syllable is the most prominent part of the word, being made so by means of the accent. In this dictionary it is denoted by the mark '. This mark, called an accent, is placed above and beyond the syllable which receives the accent, as in the words *la'bour*, *de'lay*, and *comprehen'sion*.

Many polysyllabic words are pronounced with two accents, the primary and the secondary accent, as the word *excommunication*, in which the third, as well as the fifth syllable is commonly accented. The accent on the fifth syllable is the primary, true, or tonic accent, while that on the third is a mere euphonic accent, and consists of a slight resting on the syllable to prevent indistinctness in the utterance of so many unaccented syllables. Where both accents are marked in a word, the primary accent is thus marked ', and the secondary, or inferior one, by this mark ' , as in the word *excommunica'tion*.

CHEMICAL ELEMENTS AND SYMBOLS.

By means of chemical symbols, or formulas, the composition of the most complicated substances can be very easily expressed, and that, too, in a very small compass. An abbreviated expression of this kind often gives, in a single line, more information as to details than could be given in many lines of letterpress.

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus, H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine. (See *Atom*, and *Atomic theory* under *Atom*, in Dictionary.)

When a symbol has a small figure or number under-written, and to the right of it, such figure or number indicates the number of atoms of the element. Thus—O₂ signifies two atoms of oxygen, S₅ five atoms of sulphur, and C₁₀ ten atoms of carbon.

When two or more elements are united to form a chemical compound, their symbols are written one after the other, to indicate the compound. Thus—H₂O means water, a compound of two atoms of hydrogen and one of oxygen; C₁₂H₂₂O₁₁ indicates cane-sugar, a compound of twelve atoms of carbon, twenty-two of hydrogen, and eleven of oxygen.

These two expressions as they stand denote respectively a molecule of the substance they represent, that is, the smallest possible quantity of it capable of existing in the free state. To express several molecules a large figure is prefixed, thus: 2H₂O represents two molecules of water, 4(C₁₂H₂₂O₁₁) four molecules of cane-sugar.

When a compound is formed of two or more compounds the symbolical expressions for the compound are usually connected together by a comma; thus, the crystallized magnesian sulphate is MgSO₄, 7H₂O. The symbols may also be used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the substances as they exist before the change, the other the result of the reaction. Thus, 2H₂+O₂=2H₂O expresses the fact that two molecules of hydrogen, each containing two atoms, and one of oxygen, also containing two atoms, combine to give two molecules of water, each of them containing two atoms of hydrogen and one of oxygen.

Lithium,	L	Yttrium,	Y
Magnesium,	Mg	Zinc,	Zn
Manganese,	Mn	Zirconium,	Zr

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus, H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine. (See ATOM, and *Atomic theory* under ATOMIC, in Dictionary.)

When a symbol has a small figure or number underwritten, and to the right of it, such figure or number indicates the number of atoms of the element. Thus—O₂ signifies two atoms of oxygen, S₅ five atoms of sulphur, and C₁₀ ten atoms of carbon.

When two or more elements are united to form a chemical compound, their symbols are written one after the other, to indicate the compound. Thus—H₂O means water, a compound of two atoms of hydrogen and one of oxygen; C₁₂H₂₂O₁₁ indicates cane-sugar, a compound of twelve atoms of carbon, twenty-two of hydrogen, and eleven of oxygen.

These two expressions as they stand denote respectively a molecule of the substance they represent, that is, the smallest possible quantity of it capable of existing in the free state. To express several molecules a large figure is prefixed, thus: 2 H₂O represents two molecules of water, 4 (C₁₂H₂₂O₁₁) four molecules of cane-sugar.

When a compound is formed of two or more compounds the symbolical expressions for the compound are usually connected together by a comma; thus, the crystallized magnesian sulphate is MgSO₄, 7 H₂O. The symbols may also be used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the substances as they exist before the change, the other the result of the reaction. Thus, 2 H₂ + O₂ = 2 H₂O expresses the fact that two molecules of hydrogen, each containing two atoms, and one of oxygen, also containing two atoms, combine to give two molecules of water, each of them containing two atoms of hydrogen and one of oxygen.

In iron ships the amount of deviation depends upon the direction, with regard to the magnetic meridian, in which the ship lay when being built. It is least when the ship has been built with her head south. Armour-plated ships should be plated with their head in a different direction from that in which they lay when built. The mode now

generally employed to correct deviation is by introducing on board ship masses of iron and magnets to exactly neutralize the action of the ship's magnetism. Compasses are sometimes carried on masts in iron vessels as a means of removing them from the disturbing influence of the iron of the hull. In this position they serve as standards of comparison for the binnacle compass. Wooden ships are also affected, though in a far less degree, by the direction in which they lie when building.

4. A miner's compass. *Wright*.—5. Any plate or face on which a pointer or index revolves, moves backwards and forwards, or oscillates, marking revolutions, pressure, &c., according to the nature of the machinery of which it forms part; as, the *dial* of a steam-gauge, gas-meter, or telegraphic instrument.—*Night* or *nocturnal dial*, an instrument for showing the hour by the shadow of the moon. Dialect (di'al-ekt), *n.* [Gr. *dialektos*, conversation, speech, from *dialogō*, to converse—*dia*, and *lepō*, to speak; Fr. *dialecte*.] 1. The form or idiom of a language peculiar to a province or to a limited region or people, as distinguished from the literary language of the whole people, and consisting chiefly in differences of orthography or pronunciation. The Greek language is remarkable for four dialects—the Attic, Ionic, Doric, and Eolic. A dialect is the

branch of a parent language, with such local modifications as time, accident, and revolutions may have introduced among descendants of the same stock or family living in separate or remote situations. But in regard to a large portion of words many languages which are considered as distinct are really dialects of one common tongue. In many cases dialects exhibit more accurately the ancient form of this common tongue, and are less corrupted or modified than the literary language.—2. Language; speech or manner of speaking.

If the conferring of a kindness did not bind the person upon whom it was conferred, to the returns of gratitude, why, in the universal *dialect* of the world, are kindnesses still called obligations? *South.*

SYN. Language, tongue, speech, idiom, phraseology.

The name given to the art of reasoning or disputing, or that branch of logic which teaches the rules and modes of reasoning, or of distinguishing truth from error; the method of investigating the truth by analysis; also, the science of ideas or of the nature and laws of being. Later it came to signify the art of using forms of reasoning so as to make fallacies pass for truth; word-fence.—2. (Also in the first form.) The logic of probabilities, as opposed to the doctrine of demonstration and scientific deduction.—3. (In the second form.) In *Kant's philos.* the logic of appearance, as distinguished from universal logic, or that which teaches us to excite appearance or illusion. As logical or formal, it treats of the sources of error and illusion, and the mode of destroying them; as transcendental, it is the exposure of the natural and unavoidable illusion that arises from human reason itself, which is ever inclined to look upon phenomena as things in themselves, and cognitions *a priori* as properties adhering to these things, and in such way to form the super-sensible, according to this assumed cognition of things in themselves.

We termed *Dialectic* in general a logic of appearance. This does not signify a doctrine of probability; for probability is truth, only cognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful. *Kant, translated by Mr. Gellhorn.*

4. (Also in the second form.) The method of dividing and subdividing, dissecting and analyzing a topic, so that we may be directed to the various lines of argument by which it may be approached, investigated, defended, or attacked; contrasted with *logic*, whose province it is to criticise these arguments, so as to reject the sophistical, and allow their exact weight to the solid. *Taylor.*

to show that the two vowels are to be separated in pronunciation, as in *aër*; otherwise called *Dieresis*.—2. In *rhet.* asyndeton (which see).—3. In *med.* debility; also, a solution of continuity.—4. In *chem.* the act or process of separating the crystalloid elements of a body from the colloid. This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment paper stretched over a wood or gutta-percha hoop, having its edges well drawn up, and confined by an outer rim. The parchment is allowed to float on a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the pure water beneath, whilst the colloid remains behind. Thus gruel or broth, containing a very little arsenic dissolved in it, gives up the whole of its arsenic to the water, whilst scarcely a trace of the organic substance passes through. As almost all the poisons in common use, as arsenic, strychnine, corrosive sublimate, oxalic acid, acetate of lead, morphia, &c., are crystalloids, the toxicologist is by this process furnished with a very easy mode for detecting their presence.

Dialytic (di-a-lit'ik), *a.* Pertaining to dialysis; unloosing; unbracing, as the fibres; relaxing.

Diamagnetic (di'a-mag-net'ik), *a.* [Gr. *dia*, and *magnēs*, a magnet.] Pertaining to or exhibiting the phenomena of diamagnetism; a term applied to a class of substances which, when under the influence of magnetism, and freely suspended, take a position at right angles to the magnetic meridian, that is, point east and west. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two great divisions, the *paramagnetic* and *diamagnetic*. Among the former are iron, nickel, cobalt, platinum, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horse-shoe magnet it points in a line from one pole to the other, which Faraday terms the *axial line*. On the other hand, when a diamagnetic substance is suspended in the same manner it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

Diamagnetic (di'a-mag-net'ik), *n.* A substance which, when magnetized and suspended freely, points east and west. See the adjective.

Diamagnetism (di-a-mag-net'izm), *n.* 1. That branch of magnetism which treats of diamagnetic phenomena and diamagnetic bodies.—2. Diameter (di-am-et-ēr), *n.* [Gr. *diametros*—*dia*, and *metron*, measure.] 1. A right line passing through the centre of a circle or other curvilinear figure, terminated by the circumference, and dividing the figure into two equal parts. Whenever any point of a figure is called a centre, any straight line drawn through the centre, and terminated by opposite boundaries, is called a *diameter*. And any point which bisects all lines drawn through it from opposite boundaries is called a *centre*. Thus, the circle, the conic sections, the parallelogram, the sphere, the cube, and the parallelepiped, all have centres, and by analogy diameters. Euclid uses the word *diameter* in the sense of *diagonal*.—2. In *arch.* the measure across the lower part of the shaft of a column, which, being divided into sixty parts, forms a scale by which all the parts of the order are measured. The sixtieth part of the diameter is called a *minute*, and thirty minutes make a *module*.—3. The length of a right line passing through the centre of any object from one side to the other; width; thickness;

as, the *diameter* of a tree or of a stone or of the head.

Then zeal, whose substance is ethereal, arming in complete *diamond*, ascends his fiery chariot.

Milton.

2. A mineral, gem, or precious stone, of the most valuable kind, remarkable for its hardness, as it scratches all other minerals. When pure, the diamond is usually clear and transparent, but it is sometimes coloured, the colours being white, yellow, blue, green, black, &c. In its rough state it is commonly in the form of a roundish pebble, or of octahedral crystals. It consists of pure carbon. When placed between the poles of a powerful battery it is completely burned to carbon dioxide. When pure and transparent, diamonds are said to be of the first water, and as their transparency decreases they are classed as of the second and third water. The weight, and consequently the value, of diamonds is estimated in carats, one of which is equal to 4 diamond grains or 8-174 grains troy, and the price of one diamond compared to that of another of equal colour, transparency, purity, form, &c., greatly increases with the weight. Thus, a diamond of 1 carat would bring about £21, while one of equal purity, form, &c., 2 carats in weight would bring about £80. Diamonds are valuable for many purposes. Their powder is the best for the lapidary and the gem engraver, and they are much used in the cutting of window and plate glass. They are also extensively used by copper-plate engravers as etching points, and by engineers for piercing rocks. (See DIAMOND-BORER.) The largest diamond known was found in S. Africa, weighing 871 carats, but with a large flaw in the centre. One of the most celebrated diamonds is the Koh-i-noor, now belonging to the crown of Great Britain; it originally weighed, it is said, about 800 carats, but by subsequent recutting it has been reduced to 103½ carats. The Orlov diamond, belonging to the Emperor of Russia, weighs 195 carats; and the Pitt or Regent diamond, among the French crown jewels, 136½. Diamonds are found in numerous localities in Hindustan, Malacca, Borneo, and other parts in the East. In America they occur in Brazil, North Carolina, and Georgia. They have also been found in Algeria, Australia, and latterly in large quantities in South Africa. Diamonds are cut into various forms, but chiefly into *brilliant* and *rose diamonds* or *rosettes*. The brilliant-cut best brings out the beauty of the stone, and is the most expensive and difficult; it has an upper or principal octagonal face, surrounded with many facets; the greater the number of facets, the more valuable the diamond. The rose-cut diamond has a flat base, above which are

be cut as rose diamonds are cut as *table diamonds*. Fig. 1 is the diamond in its rough state; fig. 2 is the vertical, and fig. 3 the lateral appearance of a brilliant; fig. 4, the vertical, and fig. 5 the lateral appearance of a rose-cut diamond; in fig. 6 the flat portion *a* in a cut stone is called the *table*; the part *abb*, which projects from the setting, is the *front*, the part *b b c*, sunk in the setting, is the *back* or *culasse*, while the line *b b* is the *girdle*.—3. A very small printing type.—4. A geometrical figure, otherwise called a rhombus.—5. One of a set of playing cards marked with the figure or figures of a diamond.—6. Diamonds so used are uncut, and they are so mounted as to act upon the glass, not by an angle, but by a curvilinear edge of the crystal.—*Black diamond*, a term applied colloquially to coal.—*Diamond edition*, an edition of a work printed in diamond, or very small type.—*Diamond fret* in *arch.* a species of moulding consisting of fillets intersecting each

Differential Coupling.

ling, in mach., a form of slip-coupling applied in light machinery for the purpose of regulating the velocity of the connected shaft at pleasure. It consists of an epicycloidal train, such as that represented by the annexed figure. The shaft *A*, through which the motive power is conveyed, is continuous, and the wheel *a* is fast upon it, whereas those marked *b* and *c* are loose. The two pinions *d d* (only one of which is necessary) have their bearings in the wheel *c c*, and gear with the two wheels *a a* and *b*. Motion being given to the shaft *A*, the wheel *b*, which is loose, revolves in a direction contrary to the wheel *a a*, which is fixed, and the wheel *c c* remains at rest; but the motion of the wheel *b* being opposed by means of the friction-gland *e*, which can be tightened at pleasure by the screw *f*, the teeth of that wheel become fulcra to the carrier-pinions *d d*, and these carry round the wheel *c c*, which, gearing with the wheel *h* on the second shaft, communicates motion to it of any degree of velocity not greater than half that of the driving-shaft.—*Differential duties*, in pol. econ. duties which are not levied equally upon the produce or manufactures of different countries; as, when a heavier duty is laid on certain commodities from one country than on the same commodities from another. Such duties are also called *Discriminating Duties*.—*Differential gear*, in mech., a combination of toothed wheels, by which a differential motion is produced—as exemplified when two wheels

fixed on the same axis are made to communicate motion to other two wheels on separate axes, the velocities of the latter axes differing proportionally to the difference of the diameters of the respective wheels acting upon them, or to their numbers of teeth. This combination is extensively employed in lathes and boring-machines.—*Differential motion*, in mech., an adjustment by which a single combination is made to produce such a degree of velocity, as by ordinary arrangements would require a considerable train of mechanism practically to reduce the velocity. The Chinese or *differential* windlass is an example of this kind of motion. The two cylinders *A* and *B*, a little different in diameter, have a common axis, and the cord winds from the one upon the other when the axis is made to revolve, by which means a vertical motion is communicated to the pulley *C* equal to half the difference of the surface velocities of the two cylinders *A* and *B*; or equal to the velocity that would be obtained if the centre of the pulley *C* were suspended by a cord wrapped round a single barrel, whose radius is half the difference of the radii of the cylinders *A* and *B*. Thus, although theoretically a barrel with a radius equal to that difference would do as well as the double barrel, yet its diameter in practice would be so small as to make it useless from weakness; whereas, the barrels of the differential combination may be of any diameter and strength necessary for the weights to be lifted. (See under WHEEL.) When a differential motion is effected by means of toothed wheels, the combination takes the name of *differential gear* (which see).—*Differential screw*, in mech., a compound screw, whereby a differential motion is produced—as exemplified by the annexed figure. The pitch of the threads

Differential Motion.

at *A* and *B* being different, when motion is communicated to the screw, the piece *C* (prevented from revolving) is made to slide parallel to the axis, by a quantity equal to the difference of the pitches of the two parts *A* and *B* in each revolution. Hunter's screw (which see) is another example of the same kind.—*Differential thermometer*, an instrument for measuring very small differences of temperature, invented and first applied by Sir John Leslie. Two glass tubes, each terminating in a hollow ball, and having their bores somewhat widened at the other ends, a small portion of sulphuric acid tinged with carmine being introduced into the ball of one, are joined together by the flame of a blow-pipe, and afterwards bent into nearly the shape of the letter U. To one of the legs of the thermometer so formed a scale is attached; and the liquid contained in the tube is so disposed that it stands in the graduated leg opposite the zero of the scale when both balls are exposed to the same temperature, so that the instrument is affected only by the difference of heat of

Differential Screw.

the two balls. As long as both balls are of the same temperature the coloured liquid remains stationary; but if, for instance, the ball which holds a portion of the liquid be warmer than the other, the superior elasticity of the confined air will drive it forwards, and make it rise in the opposite branch above the zero, to an elevation proportional to the excess of elasticity, or of heat.

Differential (dif-fér-en-shal), *n.* In math., an infinitesimal difference between two states of a variable quantity. In the differential and integral calculus, if two or more quantities are dependent on each other, and subject to variations of value, their *differentials* are any other quantities whose ratios to each other are the limits to which the ratios of the variations approximate, as these variations are reduced nearer and nearer to zero.

Differentiate (dif-fér-en-shi-át), *v.t.* 1. To produce, or lead to, a difference.

The assignment of a specific agency to the discharge of a specific function, as the assignment of a particular faculty in a university to the study and teaching of a particular branch of knowledge.

The faculties arose by process of natural *differentiation* out of the primitive Unity. Huxley.

3. In biol., the formation of different parts, organs, species, &c., by the production or acquisition of a diversity of new structures, through a process of evolution or development, as when the root and stem of a plant are developed from the seed, or the leaves, branches, and flowers from the stem, or when animals, as they advance in type of organization, acquire, more and more, specific organs for the performance of specific functions, in place of one organ, as in the lower organisms, serving for heart, stomach, lungs, &c.; specialization.

Differentiation is, therefore, a mark of higher organization—the higher the animal in the scale of being, the more specialized is its organization. Page.

4. In math., the act of differentiating; the operation of finding the differential of any function.

According to Liebig digestion is effected without the aid of the vital force, by a metamorphosis analogous to fermentation, by which a new arrangement of the particles is effected. It is a chemical process regulated by vital action. The gastric juice, which so greatly assists in digestion, is secreted by glands situated in the lining membrane of the stomach, which is in a state of progressive change, and the change or motion is propagated from this to the particles of the food under certain conditions, such as a certain temperature, &c. The principal meal of the day, in which respect it may be said to correspond with the *deipnon* of the Greeks and the *cæna* of the Romans, both these meals being of the most elaborate kind and taken in the evening. In medieval and modern Europe the common practice, down to the middle of the last century, was to take this meal about mid-day. Since that time the hour of dinner has been gradually put back till it has reached from six to eight in the evening among the wealthier classes.

The Court dinner-hour, in the reign of George III., was at the Hanoverian hour of four o'clock. During the reign of George IV. it gradually crept up to six o'clock, and finally became steady at the Indian hour of seven, and so remained until the reign of Her Most gracious Majesty, when the formal Court dinner-hour became eight o'clock. These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a *dinette* at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repast, which has exploded the old-fashioned luncheon of cold viands. The Queen.

It had a proboscis and two tusks placed at the anterior extremity of the lower jaw, and curved downwards somewhat after the manner of those in the upper jaw of the walrus. The zoological position of the *Dinotherium* (of which there seem to be several species) is that of a proboscidean allied to the elephant. The skull, molar teeth, and scapular bone are the only portions yet discovered. Kaup regards it as intermediate between the mastodons and tapirs, and terrestrial, while Blainville and Pictet regard it as allied to the sea-cows, and inhabiting the embouchure of great rivers, and uprooting the marsh and aquatic plants which constituted its food with its tusks.

The leaves have a dilated petiole and a slightly-stalked 2-lobed lamina, with three short stiff bristles on each lobe. The bristles are remarkably irritable, and when touched by a fly or other insect the lobes of the leaf suddenly close on and capture the insect. It is said to digest the food thus captured by means of a fluid which dissolves it exactly like ordinary gastric juice.

It produces a far greater degree of optical illusion than the panorama, and is suitable as well for architectural and interior views as for landscape. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side towards the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side and reflected from it to the other, and thence through the glass, are not coincident, but they gradually approach, as the sun or star approaches the meridian, until they exactly coincide at the instant the centre of the object is on the meridian; when an eye stationed at the side of the prism and looking to the transparent side sees only one object.

The granting of *diplomas* by universities or other learned bodies proceeds on the supposition that the public require some assistance to their judgment in the choice of professional services, and that such an official scrutiny into the qualifications of practitioners is a useful security against the imposture or incompetency of mere pretenders to skill. When a needle thus mounted is placed anywhere not in the magnetic equator, it dips or points downward; and, if the vertical plane in which it moves coincides with the magnetic meridian, the position which it assumes shows at once the direction of the magnetic force. The intersection of two or more directions, found by making the experiment at different places, indicates the place of the magnetic pole.

In severe cases the moral powers are so weakened, and the mind so enfeebled, that the dipsomania is incapable of resisting the morbid impulse, which is also usually attended by emui, irritability, painful sense of sinking at the epigastrium, and restlessness. The desire to appease this instinctive craving is, at last, imperative. When gratified, the patient becomes violent, maniacal, and dangerous to himself and to those around him. He continues to swallow the intoxicating fluids as long as he can procure them, or as long as he has the power of doing so, until the paroxysm terminates. placed upon the crown of the head, and a mouth formed for suction. The true eyes are large and compound, often containing thousands of facets. The power, which many of these animals have, of walking on smooth surfaces with the back downwards, is probably due to the fact that the feet are beset with hairs each terminating in a minute disc which acts as a sucker, the discs at the same time exuding a liquid which renders adhesion more perfect. The metamorphosis is complete.

The point of dispersion is the point where refracted rays begin to diverge. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism. The oil of cassia is therefore said to disperse the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the coloured spaces have not the same ratio to one another as the length of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the coloured spaces in the spectrum. —4. In the commercial language of this country distillation means the manufacture of intoxicating spirits, under which are comprehended the four processes of *mashing* the vegetable materials, *cooling* the worts, exciting the *vinous fermentation*, and separating, by a peculiar vessel called a still, the alcohol, combined with more or less water. The most common method of conducting the process of distillation consists in placing the liquid to be distilled in a copper vessel called the still, having a movable head from which proceeds a coiled tube called the *worm* that passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized and rises in vapour into the head of the still, whence passing down the curved tube or worm it becomes condensed by the cold water, and makes its exit in a liquid state. This liquid consists of alcohol mixed with a large portion of water. It then undergoes the process of *rectification*, in which the spirit is concentrated and purified principally by means of re-distillation. Distillation is of great importance, not only in obtaining spirituous liquors, but also in procuring essences, essential oils, &c. In practical chemistry it is indispensably necessary.—*Destructive distillation*. The uses of *diving* are important, particularly in fishing for pearls, corals, sponges, examining the foundations of bridges, recovering valuables from sunken ships, and the like. Various methods have been proposed and engines contrived to render *diving* more safe and easy. The great object in all these is to furnish the diver with fresh air, without which he must either make but a short stay under water or perish. See next article.

Diving-bell (div'ing-bel), *n.* A contrivance for the purpose of enabling persons to descend and to remain below the surface of water for a length of time, to perform various operations, such as examining the foundations of bridges, blasting rocks, recovering treasure from sunken vessels, &c.

Diving-bells have been made of various forms, such as that of a bell, a hollow truncated cone or pyramid, with the smaller end close, and the larger one, which is placed lowermost, open. The air contained within these vessels prevents them from being filled with water on submersion, so that the diver may descend in them and breathe freely for a long time, provided he can be furnished with a new supply of fresh air when the contained air becomes vitiated by respiration. The *diving-bell* is now generally made of cast-iron in the form of an oblong chest (A), open at the bottom. It has several strong convex lenses set in the upper side or roof of the bell, to admit

light to the persons within. It is suspended by chains from a barge or lighter, and can be raised or lowered at pleasure upon signals being given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of forcing pumps (B) placed in the lighters, while the heated air escapes by a cock in the upper part of the bell. An improvement on this form, called the nautilus, has been invented which enables the occupants, and not the attendants above as in the older forms, to raise or sink the bell, move it about at pleasure, or raise great weights with it and deposit them in any desired spot.

Diving-dress (div'ing-dres), *n.* A waterproof dress of india-rubber used by professional divers, having a head-piece of light metal furnished with strong glass eyes and two pliable pipes to maintain a supply of air. See DIVIDE.] The quality of being divisible; that general property of bodies by which their parts or component particles are capable of separation. All bodies which possess sensible extension may be divided into several parts, and these again may be subdivided into particles more or less small, and so on to an extreme degree of minuteness. Numerous examples of the division of matter to a degree almost exceeding belief may be found in experimental inquiries in physical science; the useful arts furnish many not less striking; but perhaps the most conspicuous proofs of the extreme minuteness of which the parts of matter are susceptible are to be found in the organized world. 'Divisibility . . . is a primary attribute of matter.' *Sir W. Hamilton*.

A legal dissolution of the bond of marriage. In England there were formerly two kinds of legal separation between man and wife called *divorces*; first, that a *mensa et thoro* (more correctly designated *separation* 'from bed and board'), and pronounced, after due inquiry, by the spiritual courts; and secondly, *divorce a vinculo matrimonii*, or complete divorce, which could only be obtained by a special act of parliament for each case. In 1857 a special court for matrimonial causes was established, and by it divorces were granted without an act of parliament. In 1875 it was merged in the Probate, Divorce, and Admiralty division of the High Court of Justice in which divorce cases are now brought. The husband may get divorce on the ground of adultery,

but the wife must prove cruelty or desertion as well. The court may also pronounce a decree of judicial separation; but such separation, although restoring to the wife full power over her property, does not entitle the parties to marry again. As to a decree nisi in a divorce case see under **DECREE**. Besides adultery, cruelty, and desertion, the principal grounds for divorce are bigamy, rape, incest, &c. In Scotland the grounds of divorce are adultery by either party whether coupled by desertion or cruelty or not, or wilful desertion for four years or more on the part of either husband or wife. The jurisdiction in divorce cases, by act Wm. IV. lxix., was given to the Court of Session. In the United States and some countries on the Continent, divorce can be obtained on much slighter grounds.—2. Separation; disunion of things closely united. The name is sometimes applied also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is pro-

Constantine Dolmen, Cornwall.

bably that known as the Pierre Couverte, near Saumur. It is 64 feet long, 14 feet wide, and about 6 feet high, and consists of four upright stones on each side, one at each end and four on the top. The dolmen represented in accompanying cut consists of a

vast stone 33 feet long, 14½ deep and 13½ across. This stone is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchres, although afterwards they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of the first rude dwelling erected by man, and sometimes may have been the actual structure in which he sheltered himself, converted afterwards into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Circassia, Algeria, and Europe; but too much importance may be attached to this, as the dolmen is really the structure which savages of a very low type, of whatever race, would naturally erect for shelter. See CROMLECH, MENHIR.

The second class is that of *dolmens*, too often called cromlechs in this country. . . . It may probably be assumed that the *dolmen* was originally a stone cist in the centre of a tumulus, meant to contain either one or more bodies. This afterwards was expanded into a chamber for the accommodation of several. In the third stage it was furnished with a passage or avenue of entrance so as to be permanently accessible. In the fourth stage the covering tumulus was dispensed with; but the last form most probably was when the *dolmen* was placed externally on the top of the mound as a mere ornament or simulated tomb. *Quart. Rev.*

In using the phrase the translator had really not a cupola but a cathedral interior in his eye, and he sees no reason against extending the English *dome* into the German *dom* (*domus*), to say nothing of *dōma* being presumably the warrant in the one case as in the other. *Preface*, 3d Ed.

3. In *arch.* in a limited sense, a tholus or cupola in the form of an inverted cup; the hemispherical coving of a building. This restriction of the application of the term appears to have arisen from the Italian custom of calling an archiepiscopal church *Il duomo*, and from the circumstance that the chief churches of Italy were at one time almost universally so roofed.—4. In *myth*, a fabulous animal, conceived, physically, as a sort of winged crocodile, with fiery eyes, crested head, and enormous claws, spouting fire, and, morally, as the embodiment of evil, of malicious watchfulness and oppression. The immediate source of the mediæval conception is no doubt the Scriptures, the conception being modified, however, first by the fact that in Welsh the word *dragon* signifies a chief (so that to kill a *dragon* was the highest glory of an English knight), and by the accounts brought home by Crusaders of the crocodiles they had seen in Egypt. The slaying of the dragon by St.

George is probably an allegory to express the triumph of the Christian hero over evil. The scriptural conception of the dragon was probably derived from Egypt; the Chinese dragon is probably an independent conception. In *her*, it is borne in shields, crests, and supporters.—2. All the species are small and inoffensive. *Draco volans*, the best type of the genus, is about 10 or 12 inches in length, the tail being extremely long in proportion to the body, which is not above 4 inches.

Each of the two players is provided with twelve pieces or 'men' placed on every alternate square at each end of the board. The men are moved forward diagonally to the right or left one square at a time, the object of each player being to capture all his opponent's men, or to hem them in so that they cannot move. or roll a body over a plain surface it has to overcome two obstacles; one is the friction with the surface over which the body slides or rolls, and the other is the weight of the body itself. There is in every case a certain direction of the drawing power which is best adapted to overcome these conjoined obstacles; and the angle made by the line of draught with the plane over which the body is drawn is termed the *angle of draught*. Dualism (dū'al-izm), *n.* The dividing into two; a twofold division; a system founded on a double principle.

An inevitable *dualism* bisects nature, so that each thing is a half, and suggests another to make it whole; as spirit, matter; man, woman; subjective, objective; in, out; upper, under; motion, rest; yea, nay. . . . The same *dualism* underlies the nature and condition of man. Emerson.

Hence—(a) the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles not derived from each other. Dualism is chiefly confined to the adoption of two fundamental beings, a good and an evil one, as is done in the oriental religions, and to the adoption of two different principles in man, viz. a spiritual and a corporeal principle. (b) In *theol.* the doctrine of those who maintain that only certain elected persons are capable of admission to eternal happiness, and that all the rest will be subjected to eternal condemnation. (c) *Met.* the doctrine of those who maintain the existence of spirit and matter as distinct substances, in opposition to idealism, which maintains we have no knowledge or assurance of the existence of anything but our own ideas or sensations. Dualism may correspond with realism in maintaining that our ideas of things are true transcripts of the originals or rather of the qualities inherent in them, the spirit acting as a mirror and reflecting their true images, or it may hold that, although produced by outward objects, we have no assurance that in reality these at all correspond to our ideas of them, or even that they produce the same idea in two different minds.

Berkeley then is right in triumphing over Realism and *Dualism*. Right in saying that if he were to accord them the existence of matter they could make no use of it. The subject would remain as dark as before; matter throws no light on it. G. H. Lewes.

The combat generally takes place in the presence of witnesses called seconds, who make arrangements as to the mode of fighting, place the weapons in the hands of the combatants, and see that the laws they have laid down are carried out. It is in much less common use in Europe now than it was a century or two ago, and is interesting chiefly as being the prototype of the piano. It is still, however, occasionally to be met with on the Continent at rustic rejoicings, and in England in the hands of street musicians. In

Italian Dulcimer.

Asia it is especially used by the Arabs and Persians, as well as by the Chinese and Japanese, with, however, great modifications in structure and arrangements. The ancient eastern dulcimer, as represented in Assyrian bas-reliefs, seems to have differed from the modern instrument in being carried before the player by a belt over the shoulder, in the strings running from top to bottom, as in the violin, and in being played by one plectrum, the left hand being apparently employed either to twang the strings or to check vibration. Dutch (dutch), *n.* [*G. deutsch*, German; *O.H.G. diutisc*, from *diot. A. Sax. theod*, Goth. *third*, people.

Within the last two hundred years we have got into a strange way of using the word *Dutch* to mean only one particular class of Dutchmen, namely, our own Low Dutch kinsmen in Holland and the other provinces which now make up the kingdom of the Netherlands. But we formerly used the word in a much wider sense, and men use it so still in many parts of the United States. English travellers in America have sometimes been puzzled at hearing men whom they would have called Germans spoken of as *Dutchmen*. You will do well to bear this in mind; when you find the word *Dutch* in any English writer of the sixteenth century, or of the first half of the seventeenth, it is pretty certain to mean, not Hollanders in particular, but Hollanders, Saxons, Swabians, Bavarians, and so forth, altogether. And I need hardly tell you that the Germans call themselves and their tongue *Deutsch* to this day; only, a little confusion now and then arises from their using the word *Deutsch*, sometimes to express the Teutonic race in general, and sometimes to express their own particular nation and language. *Teuton* and *Dutch* are, in truth, only two forms of the same name. The word comes from *that* people, nation; each nation, of course, thinking itself the people or nation above all others. And the opposite to *Dutch* is *Welsh*—that is, *strange*, from *weath*, a stranger. In our forefathers' way of speaking, whatever they could understand was *dutch*, the tongue of the people, whatever they could not understand they called *Welsh*, the tongue of the strangers. 'All lands, *Dutch* and *Welsh*,' is a common phrase to express the whole world. This is the reason why, when our forefathers came into Britain, they called the people whom they found on the land the *Welsh*. For the same reason, the Teutons on the Continent have always called the Latin-speaking nations with whom they have had to do—Italians, Provencals, and French—*Welsh*. People who know only the modern use of the words might be puzzled if they turned to some of the old Swiss chronicles, and found the war between the Swiss and Duke Charles of Burgundy always spoken of as a war between the *Dutch* and the *Welsh*. Any one who knows German will be at once reminded with instances of this use of the word, sometimes meaning *strange*, or *foreign* in the general sense, sometimes meaning particularly French or Italian. The last case which I know of the word being used in England in the wide sense is in Sir Thomas Smith's book on the Government of England, written in the time of Queen Elizabeth, where he speaks of 'such as be *welsh* and *foreign*,' not meaning Britons in particular, but any people whose tongue cannot be understood. *E. A. Freeman*.]

1. Originally, the Germanic race; the German peoples generally: now only applied to the people of Holland.

Dynamics (di-nam'iks), *n.* [Gr. *dynamis*, force or power.] 1. The science which investigates the action of force. Hence the science of dynamics is divided into two branches, to which the names *statics* and *kinetics* are respectively given. In popular usage, however, it has been customary to give to the science of force the name *mechanics*, in which case the branch which treats of force applied so as to compel rest or prevent change of motion is called *statics*, while that which considers force applied so as to cause or change motion is called *dynamics*.—2. When the pull upon a draught implement, as a plough, is the point to be determined, the dynamometer is made a link in the draught chain, and then subjected to the tension which it is desired to ascertain. In such cases the instrument used is simply a spring; and by the amount of extension or collapse which it suffers the intensity of the strain which it has undergone is indicated. One of the most common dynamometers of this kind is formed of an elliptical spring, which in proportion to the longitudinal extension suffered when in use experiences a lateral collapse the measure of which indicates the amount of strain to which it has been subjected. In Clynburn's dynamometer the strain is indicated by the compression of a spiral spring inclosed in a cylindrical case, the extent of the strain being shown by an index moving along a scale on the outside of the instrument.

See DEVOUR.] In *old Scots law*, a bankrupt who has made a *cessio bonorum* to his creditors.

Dzeren, Dzeron (dzē'ren, dzē'ron), *n.* The Chinese antelope, a remarkably swift species of antelope (*Procavia gutturosa*), inhabiting the dry arid deserts of Central Asia, Tibet, China, and Southern Siberia. It is nearly 4½ feet in length, and 2½ high at the shoulder. When alarmed it clears 20 to 25 feet at one bound.

Dziggetai (dzig'ge-tā), *n.* The wild ass of Asia (*Equus hemionus*), whose habits are so graphically recorded in the book of Job, and believed to be the *hemionos* of Herodotus and Pliny. It is intermediate in appearance and character between the horse and ass (hence the specific name *hemionus*, half-ass), the males especially being like animals, standing as much as 14 hands high. It lives in small herds, and is an inhabitant of the sandy steppes of Central Asia, 16,000 feet above sea-level. Called also *Kiang*, *Koulan*, and *Khur* or *Goor*.

E.

E, the second vowel and the fifth letter of the English alphabet. It occurs more frequently in English words than any other letter of the alphabet, this frequency being partly owing to the fact that *e* has taken the place of the older (Anglo-Saxon) vowel endings *a*, *o*, and *u*. Its long or natural sound in English coincides with the sound of *i* in the Italian and French languages, as in *here, mere, me*. It has also another principal sound, a short one, heard in *met, men*. It has besides a sound like *a* in *name*, as in *there, where*, &c., and the obscure sound which is heard in *her*. As a final letter it is generally silent; but it serves to lengthen the sound of the preceding vowel, or at least to indicate that the preceding vowel is to have its long sound, as in *mane, cane, plume*, which, without the final *e* would be pronounced *man, can, plum*. After *e* and *g* the final *e* serves to indicate that these letters are to have their soft sounds, *e* being pronounced as *s*, and *g* as *j*. Thus without the final *e* in *mace* (*mās*) this word would be pronounced *mac* (*mak*), and *rage* (*rāj*) would be pronounced *rag*. When two *e*'s come together the sound is generally the same as that of the single *e* long, as in *deem, esteem, need* (comp. however *pre-exist*, &c.); and when it occurs with an *i*, as in *mean, hear, siege, deceive*, it often has the same sound. Such a combination, when only one vowel sound is heard, is called a digraph. In these combinations the sound is usually that of *e* long, but sometimes it is the short sound of *e*, as in *lead* (pronounced led), a metal, *read* (pronounced red), pret. of *read*, and sometimes the sound of *a* long, as in *reign, feign*. Irregularities of this kind are not reducible to rules. See also under *A*.—As a numeral, *E* stands for 250.—In the calendar it is the fifth of the Dominical letters.—As an abbreviation it stands for *East*, as in charts; *E*, by *S*, east by south; in the abbreviative combination *e.g.*, for *exempli gratia*, for example; and in *i.e.*, for *id est*, that is.—*E*, in music, is the third note or degree of the

diatonic scale, answering to the *mi* of the Italians and French. Also, the key having four sharps in its signature; and the keynote of the church mode called Phrygian.

And the princes of Israel, being twelve men; *each* one was for the house of his fathers. *Num. i. 44.*

Simeon and Levi . . . took *each* man his sword. *Gen. xxxiv. 25.*

To *each* corresponds *other*; as, let *each* esteem *other* better than himself; as, it is our duty to assist *each other*; that is, it is our duty to assist, *each* to assist the *other*.

The *eagerness* and strong bent of the mind after knowledge, if not warily regulated, is often a hindrance to it. *Locke.*

2.† Tartness; sourness.—*Eagerness, Earnestness, Avidity.* *Eagerness* springs from an intense desire for the gratification of a strong emotion or passion, and tends to produce corresponding keenness in the pursuit of the object. Strictly, the term designs the feeling only, and although strongly stimulating to, eagerness does not necessarily involve action. *Earnestness* is a more sober feeling, proceeding from reason, conviction of duty, or the less violent emotions. It has a special reference to effort, and does not necessarily imply desire for the attainment of an object. Thus we make *earnest* inquiries after the health of a friend, but *eager* inquiries after a person of whom we are in keen chase. *Earnestness* implies solidity, sincerity, and energy, and

conviction of the laudableness of the object. Neither a flighty person, a hypocrite, nor a sluggard can be earnest in religion. *Earnestness* is the more general term, and affects a person's whole character; *earnerness* is a specific feeling. An earnest man is earnest as regards all that he undertakes, but a man is *earner* only after what excites a specific desire. *Avidity* has regard to acquisition, either with the view of aggrandizing one's self or satisfying a natural craving. We eat, drink, or acquire learning with *avidity*, but the young soldier rushes to the fight with *earnerness*.—*SYN.* Ardour, zeal, vehemence, impetuosity, enthusiasm, heartiness, earnestness, fervour, avidity, greediness.

The tongue is bifid, the wings long and usually pointed, legs robust, claws curved, sharp and strong, and the tarsi feathered to the very base of the talons, by which they are distinguished from the *ernies* or sea-eagles. There are numerous species, of which the noblest is the golden eagle (*A. chrysaetos*)

Golden Eagle (*Aquila chrysaetos*).

of Europe, found still in the more mountainous parts of Britain. The male is 3 feet, and the female 3½ feet long. It feeds chiefly on birds that live near the earth, and hares, rabbits, lambs, &c. Other species are the imperial eagle (*A. imperialis*), the spotted eagle (*A. nevia*), the Australian eagle (*A. fucosa*), &c. The name eagle is applied to other members of the group, though not belonging to the genus *Aquila*, as the white-tailed sea-eagle of Britain (*Haliaeetus albi-cilla*), and the American white-headed sea-eagle (*H. leucocephalus*), the emblem of the United States, both of which are really *ernies*, and to the marsh eagle, harpy eagle, eagle-hawk of the genus *Falco*, &c. From its size, strength, rapidity of flight, and keenness of sight, the eagle has ever been regarded as the 'king' of birds. By the ancients it was called 'the bird of Jove,' and it was borne on the Roman standards. Many modern nations, as France under the Bonapartes, Russia, Prussia, Austria, the United States, &c., have adopted it as their national emblem. In heraldry it is one of the most noble bearings in coat armour.—2. A gold coin of the United States, of the value of ten dollars, or forty-two shillings sterling. 3. These nodules often embrace at the centre a kernel or nucleus, sometimes movable, and always differing from the exterior in colour, density, and fracture. To these hollow nodules the ancients gave the name of *eagle-stones*, from an opinion that the eagle transported them to her nest to facilitate the laying of her eggs.

3. Being in good season; as, the court met at an early hour.—**Early English architecture**, the style of architecture into which the Norman passed, and the first in which no foreign influence is perceptible: called also the *First Pointed* or *Lancet Style*. Its period is from 1139 to 1307. Its general characteristics, as distinguished from the Norman, are delicacy, refinement, and grace. The columns and shafts become more slender and elegant, foliage in some instances sprouting out from the central pillar between the shafts; the mouldings are more delicately rounded and alternated with hollows so as to give the finest effects of light and shade; the capitals frequently represent an inverted bell, and are often enriched with foliage, as of the trefoil, rising from the neck-moulding and coming beautifully outwards beneath the abacus; the towers are loftier and crowned by a spire; buttresses project boldly and vary little through entire length; roofs groined, with a ridge-rib added to the ribs of the Norman; wall-arcades very noble, their spandrels often filled with sculpture. But the distinctive features of this style are pointed arches, long, narrow, lancet-shaped windows without mullions, and a peculiar projecting ornament in the hollows of the mouldings, called the dog-tooth ornament. Towards the end of the

period the windows became grouped in a manner that led to the development of tra-

In the *law of Scotland*, earnest is held as evidence of the completion of the contract; and the party who resiles, besides losing the earnest he has paid, may be compelled to perform his obligation. After the tenth century the fashion seems to have declined both in England and the Continent, and ear-rings are neither found in graves nor discerned in paintings nor sculptures. The wearing of ear-rings was re-introduced into England in the sixteenth century, and Stubbs, writing in the time of Queen Elizabeth, says, 'The women are not ashamed to make holes in their ears whereat they hang rings and other jewels of gold and precious stones.' In the seventeenth century ear-rings were worn by male fops.

Earth (ērth), *n.* [A. Sax. *eorthe*; Goth. *airtha*, Icel. *jörth*, Sw. and Dan. *jord*, G. *erde*, allied to A. Sax. *eara*, soil, home, dwelling, and perhaps to Gr. *erē*, Skr. *āra*—earth, and to L. *arē*, to plough.] 1. The particles which compose the mass of the globe, but more particularly the particles which form the mould on the surface of the globe; any indefinite mass or portion of that matter; as, we throw up earth with a spade or plough; we fill a pit or ditch with earth; we form a rampart with earth. This substance being considered by ancient philosophers as simple, was called an element; and in popular language we still hear of the four elements—fire, air, earth, and water.—2. The terraqueous globe which we inhabit. It is one of the planets, and the third in order from the sun, its orbit embracing those of Mercury and Venus, but being within the orbits of all the other planets. The earth is endowed with two principal motions: first, a motion round its axis, from west to east, in twenty-four hours; and secondly, a motion of revolution round the sun. It is the first of these motions which produces the phenomena of day and night, and the apparent diurnal revolution of the heavenly bodies. The time in which the earth's rotation is performed is measured by the interval which elapses between two transits of the same fixed star over the meridian of any place, and this interval is always precisely the same. It is called a sidereal day, and forms a perfectly uniform measure of time. The revolution of the earth about the sun is performed in an elliptic orbit, having the sun in one of the foci, and its mean distance from the sun, as calculated by Mr. Hind from Leverrier's determination of the solar parallax, is 91,328,600 miles. The time in which the earth performs a revolution in its orbit with respect to the fixed stars is 365 days, 6 hours, 9 minutes, 9.6 seconds. This is called the sidereal year. (See *YEAR*.) The plane which contains the earth's orbit is called the ecliptic. The earth's axis is inclined to this plane in an angle of 66° 32' 4", whence the earth's equator is inclined to the ecliptic in an angle of 23° 27' 56". This inclination, which is called the obliquity of the ecliptic, gives rise to the phenomena of the seasons. The figure of the earth is that of an oblate spheroid of revolution, the polar axis being to the equatorial diameter in the ratio of 301 to 302. The equatorial diameter is nearly 7926 English miles, the polar diameter about 7898 miles, and the mean diameter 7912 miles. Two-thirds of the earth's surface are covered with water; its mass compared with that of the sun is nearly as 1 to 355,000; its mean density is to that of water as $\frac{5}{8}$ to 1.—3. The world, as opposed to other scenes of existence.

It is used for paints.—*Earth of bone*, a phosphate of lime existing in bones after calcination.—*Earth currents*, in elect. strong irregular currents, which disturb telegraphic lines of considerable length, flowing from one part of the line to another, affecting the instruments and frequently interrupting telegraphic communication. In the more advanced form of these structures two or three chambers are found. Earth-houses are frequent in the north-east of Scotland, occasionally thirty or forty being found in the same locality, as in the Moor of Clova, Kildrummy, Aberdeenshire. Querns, bones, deer's horns, plates of stone or slate, earthen vessels, cups and implements of bone, stone cells, bronze swords, and the like, are occasionally found in connection with them. It is brown, the size of a chestnut, of a sweetish farinaceous nature, resembling in taste the common chestnut. Swine are very fond of the nuts, and fatten rapidly where they are abundant. The name is frequently applied to *Bunium Bulbocastanum*, which has a similar tuber. The earth-nut of Egypt is the tuber of *Cyperus rotundus* and other species of the same genus, that of China the subter-

Earthquake (érth'kwák), *n.* A shaking, trembling, or concussion of the earth; sometimes a slight tremor; at other times a violent shaking or convulsion; at other times a rocking or heaving of the earth. The earthquake shock generally comes on with a deep rumbling noise, or with a tremendous explosion resembling the discharge of artillery, or the bursting of a thunder-cloud; the ground is raised vertically at the centre of the disturbed tract, but the movement is more oblique the farther we proceed from that centre; and the rate of increase of obliquity furnishes material for calculating the depth of the shock below the surface. (See SEISMOLOGICAL MOVEMENTS, SEISMOGRAPH.)

The single shocks of an earthquake seldom last more than a minute, but they frequently follow one another at short intervals for a considerable length of time. During these shocks large chasms are often made in the ground, from which sometimes smoke and flames, but more frequently stones and torrents of water, are discharged. In violent earthquakes these chasms are sometimes so extensive as to overwhelm whole cities at once. In consequence of these shocks, also, whole islands are frequently sunk, and new ones raised; the course of rivers is changed, and seas overflow the land. There is little doubt that earthquakes and volcanoes are due to the operation of a common cause, namely, the internal igneous forces of the earth. Probably the most destructive earthquake of modern times was that which nearly destroyed Lisbon in 1755, by which from about 30,000 to 40,000 persons are said to have perished, although it lasted only the short space of six minutes. No part of the earth is entirely free from the influence of earthquakes, and in South America in particular they are almost constantly occurring. The *earthquake-wave*, caused by the retiring and sudden recoil of the sea upon the land, causes perhaps as much destruction as the earthquake itself. See VOLCANO.

It moves by the contractions of successive parts of the body, aided by a double row of bristles running down the lower surface of the body, which are capable of being drawn within small hollows when not in use. Earthworms are highly useful, giving a kind of under-tillage to the land, loosening the earth, and rendering it permeable to the air. They are food for birds, fishes, &c., and their value for bait is well known to the angler. The name is common to all the species of the genus *Lumbricus*.—2. A mean sordid wretch.

we cannot speak of an *eccentric* body; but we speak of a person having an *eccentric* appearance, meaning an appearance indicating eccentricity, or resulting from eccentricity, as by being strangely dressed. *Singular* asserts that a thing is unique, or approximately so; *strange* [L. *extraneus*, foreign] that it is unknown to the speaker; but what is strange to one man may not be so to another. What is strange to most, or to all, is *singular*. *Odd*, when applied to the person, infers singularity and grotesqueness; as, an *odd* figure. When applied to the mind it is nearly equivalent to *eccentric*, but is somewhat stronger, implying a slight degree of craziness; as, he is somewhat *odd*. When applied to actions and conditions, or their negation, it frequently implies some degree of wonder, and is nearly equal to surprising; as, it is *odd* that he should say so; it is *odd* he does not write.

Eccentric (ek-sen'trik), *n.* 1. In *anc. astron.* a circle the centre of which did not coincide with that of the earth.

In *mach.* a term applied to a group of mechanical contrivances for converting circular into reciprocating rectilinear motion, consisting of variously shaped discs, attached to a revolving shaft, and according to the shape of the working surfaces distinguished as triangular, heart-shaped, toothed, or circular eccentrics. The cut represents the eccentric in general use for working the valves of steam-engines. It consists of a wheel situated on the main shaft but fixed out of its centre; it is fitted in a metal ring or strap, to which a shaft or shafts are attached; these are connected with the valve lever, so that as the eccentric turns round with the shaft, an alternate motion is communicated to the lever, and the valves are thereby opened and closed.

c, eccentric-rod.

cating rectilinear motion, consisting of variously shaped discs, attached to a revolving shaft, and according to the shape of the working surfaces distinguished as triangular, heart-shaped, toothed, or circular eccentrics. It consists of a wheel situated on the main shaft but fixed out of its centre; it is fitted in a metal ring or strap, to which a shaft or shafts are attached; these are connected with the valve lever, so that as the eccentric turns round with the shaft, an alternate motion is communicated to the lever, and the valves are thereby opened and closed.

A ring is fastened to the tail, and a rope being attached to it, the sucking-fish is carried out by the fishermen in their boat, in a vessel of water, and thrown into the sea where the turtles resort. In endeavouring to make its escape the fish attaches itself to the nearest turtle; and as its adhesive powers are strong, both are hauled in together. Another species is the *E. Echinodermata (ē-kīn'ō-dēr'ma-ta), *n. pl.* A class of invertebrate animals characterized by having a tough integument in which lime is deposited as granules (as in the star-fish and sea-cucumber), or so as to form a rigid test like that of the sea-urchin; and by the radial arrangement of all the parts of the adult, except the digestive system of the sea-urchin. A water system, usually communicating with the exterior, opens into the ambulacra or tubular feet, which are the locomotive organs, and are put into use by being distended with fluid. Their development is accompanied with metamorphosis, and the embryo shows a distinctly bilateral aspect. On this account, and because the adult arises as a secondary growth within the primitive embryo, the Echinodermata are now removed from the Cuvierian Radiata, and classed with the Scolecida in the sub-kingdom Annuloida. The sexes are distinct. The class is divided into seven orders—the Echinoidea (sea-urchins), Asteroidea (star-fishes), Ophiuroidea (sand-stars and brittle-stars), Crinoidea (feather-stars), Cystidea (extinct), Blastoida (extinct), and Holothuroidea (sea-cucumbers). Echo (e'kō), *n.* [L. *echo*; Gr. *ēchō*, from *ēchē*, a sound of any sort, whence *ēchō*, to echo.] 1. A sound reflected or reverberated from a solid body; sound returned; reperussion of sound; as, an *echo* from a distant hill.

The babbling *echo* mocks the hounds,
Replying shrilly to the well-tuned horns,
As if a double hunt were heard at once. *Shak.*
Which makes appear the songs I made
As echoes out of weaker times. *Tennyson.*

Sound being produced by waves or pulses of the air, when such a wave meets an opposing surface, as a wall, it is reflected like light and proceeds in another direction, and the sound so heard is an echo. When the echo of a sound returns to the point whence the sound originated, the reflecting surface is at right angles to a line drawn to it from that point. An oblique surface sends the echo of a sound off in another direction, so that it may be heard elsewhere, though not at the point where the sound originated. If the direct and reflected sounds succeed each other with great rapidity, which happens when the reflecting surface is near, the echo only clouds the original sound, but is not heard distinctly, and it is such indistinct echoes which interfere with the hearing in churches and other large buildings. An interval of about one-ninth of a second is necessary to discriminate two successive sounds; and as sound passes through the atmosphere at the rate of about 1125 feet in a second, $\frac{1}{9}$ of 1125, or about 62 feet, will be the least distance at which an echo can be heard. The wall of a house or the rampart of a city, the surface of a cloud, a wood, rocks, mountains, valleys, produce echoes. Some echoes are remarkable for their frequency of repetition.—2. In *class. myth.* a nymph, the daughter of the Air and Earth, who, for love of Narcissus, pined away till nothing remained of her but her voice.

Sweet Echo, sweetest nymph, that liv'st unseen
Within thy airy shell. *Milton.*

Education (ed-ū-kā'shon), *n.* [*L. educatio*. See **EDUCATE.**] The bringing up, as of a child; instruction; formation of manners. Education comprehends all that course of instruction and discipline which is intended to enlighten the understanding, correct the temper, cultivate the taste, and form the manners and habits of youth, and fit them for usefulness in their future stations. In its most extended signification it may be defined, in reference to man, to be the art of developing and cultivating the various physical, intellectual, æsthetic, and moral faculties; and may thence be divided into four branches—physical, intellectual, æsthetic, and moral education. This definition is by no means complete; but it is used merely as indicative of the manner in which this subject has generally been discussed. Under physical education is included all that relates to the organs of sensation and the muscular and nervous system. Intellectual education comprehends the means by which the powers of the understanding are to be developed and improved, and a view of the various branches of knowledge which form the objects of instruction of the four departments above stated. Æsthetic education comprehends the agencies which purify and refine the mind by train-

ing it to perceive and take delight in what is beautiful, true, and pure in nature, literature, and art, and to shrink from what is gross, lewd, and unlovely. Moral education embraces the various methods of cultivating and regulating the affections of the heart.

A body specially developed in the females of a great many animals, besides birds, and in which, by impregnation, the development of the young animal takes place, generally of a roundish form and in birds having a calcareous shell; an ovum. Regarded physiologically there are three essential parts in an egg, viz. the germinal spot or dot, the germinal vesicle, and the vitellus or yolk—the first being contained in the germinal vesicle, which again is contained within the body of the yolk. The eggs of most animals lower than the bird have no more than these three parts. The eggs of birds, however, have, besides these, the white, or albumen, and the shell, which consists of a membrane coated with carbonate of lime. The yolk consists of a strong solution of albumen, in which multitudes of minute globules of oil are suspended. (See **OVUM**.) Peter and John called themselves elders. The first councils of Christians were called *presbyteria*, councils of elders. In the modern Presbyterian churches elders are officers who, with the pastors or ministers, compose the consistories or kirk-sessions, with authority to inspect and regulate matters of religion and discipline in the congregation. As a member of the kirk-session, the elder has an equal vote with his minister, and as a member of the higher church courts, when delegated thereto, he has a right to reason and vote on all matters under discussion in the same manner as the clergy themselves.

Electricity (ē-lek'tris-ti), *n.* [See ELECTRIC.] The name used in connection with an extensive and important class of phenomena, and usually denoting either the unknown cause of the phenomena or the science that treats of them. In the latter usage it may be defined as the branch of natural philosophy which investigates the attractions and repulsions, the production of light, and the elevation of temperature, as well as the explosions and other phenomena attending the friction of vitreous, resinous, and metallic surfaces, and the heating, cooling, evaporation, and mutual contact of a great number of bodies. The first knowledge of electricity was due to the following out the observation made by Thales, that amber, called by the Greeks *elektron*, when rubbed, acquired the property of attracting light substances. It was subsequently observed that glass and various other substances, when rubbed, acquired the same property. If a dry glass rod be rubbed with a silk handkerchief, or a piece of amber or sealing-wax with a woollen cloth, and be presented to light bodies, such as fragments of paper, thread, cork, light straws, or little bits of gold-leaf, the light bodies are first attracted, but immediately after contact with the glass or sealing-wax they are again repelled. For example, if to a small pith-ball, formed from the pith of the elder-tree, suspended by a silk thread, we present the rubbed glass rod, we find the attraction is momentary, and is followed by as brisk a

repulsion, any attempt to bring the rod near to the pith only serving to drive it farther away. But if an excited stick of sealing-wax be brought near, the pith instantly flies to it, only, however, to be in a moment cast off, as it had been by the glass before. Banished from the wax, it will now be received by the glass for an instant, a continual exchange of sympathy for the one or the other body being kept up as long as the excitement which gives rise to these phenomena continues. Again, if a second ball is brought near to the first, which has previously been in contact either with the wax or with the glass, attraction is first exhibited between the two balls and then repulsion. From these facts we learn that friction of glass with silk, or of sealing-wax with a woollen cloth, confers on these bodies new properties. They become *excited* or *electricified*. They have also the power of communicating their electricification to other bodies, and, again, a body electricified by either of them can electrify a third. There are two kinds of electricification, one like that of glass, and one like that of wax; hence the former has been sometimes called *vitreous*, and the latter *resinous electricity*. But these terms are not quite correct, as either kind may be got from the glass or from the wax by varying the nature of the rubber. For *vitreous* and *resinous*, the terms *positive* and *negative* are now used—*positive electricity* being like that evoked on glass by rubbing with silk, and *negative*, like that evoked on sealing-wax by rubbing with flannel. The experiment with the two balls shows that an electricified body communicates to another in contact with it electricity of the same sort as it possesses itself; and hence from this experiment, in connection with those that preceded it, we learn that *similarly electricified bodies repel each other, and dissimilarly electricified bodies attract each other*. Finally, we observe that neutral bodies are attracted by those which are electricified. After a while the excited body loses its influence, but it may again be renewed by friction; and if the body be sufficiently excited, and touched by the knuckle or a metallic ball, there is a slight crack, and a spark (called the *electric spark*) is emitted between the two bodies. Every substance which we rub will not exhibit the phenomena of attraction and repulsion. A rod of metal held in the hand will show no trace of electricity, though it be rubbed ever so long. It is plain, therefore, that all bodies are not alike with regard to the electrical state. The difference used to be explained by saying that certain bodies, as amber, glass, resin, &c., were *electrics*, while the metals and others were *non-electrics*; but such an explanation is erroneous, for if we hold the metal by a glass handle while we rub it, it will at once show its attractive power. The true explanation lies in the fact, that in some substances the electrical condition is no sooner produced at any part than it spreads to all the rest, while in others it diffuses itself over the body slowly and with great difficulty. This leads up to a division of substances into *conductors* and *non-conductors* of electricity, according as they admit or do not admit this instant diffusion or transmission of the electric state. *Non-conductors*, as dry air, glass, shellac, &c., are also termed *insulators*, because the electricity of an electric body which is surrounded by such, is prevented from escaping over other conductors. The earth is a great conductor of electricity. Besides friction there are other sources of electricity. After cleavage or pressure certain laminated minerals, as mica, arragonite, calcareous spar, exhibit strong electric excitement at the surfaces cleft or pressed, one of these surfaces being always positive, the other negative. Many other bodies, not minerals, possess the same property; thus, if a disc of cork and a disc of india-rubber be pressed together and then separated, the former is found to be electricified positively, and the latter negatively. Change of temperature produces electricity; thus, if a crystal of tourmaline is warmed, it shows positive electricity at one extremity of its principal axis, and negative at the other. There are several other sources of electricity, as the motion of magnets (see MAGNETISM), the application of heat to a junction of two dissimilar metals (see THERMO-ELECTRICITY), and chemical action (see GALVANISM, GAL-

VANIC). Free electricity has the power of inducing the bodies near it to assume a peculiar electric condition; thus, if upon either extremity of a brass cylinder with rounded ends, insulated on a glass pillar, we hang two pith-balls by means of cotton threads, and place within a few inches of the end of the cylinder a glass tube which has been briskly rubbed, the balls at each end diverge, showing that each pair is charged with similar electricities. When the glass tube is withdrawn, the balls hang down as before, so that the electrical excitement of the cylinder is merely temporary and dependent on the proximity of the tube. This action of the tube, inducing in the cylinder its peculiar electrical condition, is called *induction*, and the cylinder in this state is said to be *polarized*, that is, to have its poles or ends like a magnet, each having its similar but relatively opposite force. (See INDUCTION, POLARITY.) Electricity, when accumulated in large quantities, becomes an agent capable of producing the most sudden, violent, and destructive effects, as in thunder-storms; and even in its quiescent state it is extensively concerned in the operations of nature. It is an important chemical agent, and its use has been lately much extended in the arts and manufactures. Many theories as to the nature of electricity have been proposed, but its real character is yet unknown. The two most important are the *fluid* theories of Franklin and of Symmers. Franklin held that all bodies, when in a neutral state, contain a definite quantity of an extremely elastic, imponderable fluid, which repels itself, but attracts matter. Bodies are positively electricified when they have more than their natural share of it, and negatively when they have less. Symmers' theory is that bodies, in the neutral state, contain equal amounts of two electrical fluids of opposite characters. By friction and otherwise these can be separated, one going to each body rubbed. Each repels itself but attracts the other, and one is peculiar to rubbed glass and the other to rubbed sealing-wax.—*Animal electricity*, galvanism (which see).—*Atmospheric electricity*, the electricity which is produced in the atmosphere, and which becomes visible in the form of lightning.

(See POTENTIAL.) The most important instrument of this class is Sir W. Thomson's *quadrant electrometer*. Sir W. Thomson has also invented a *portable electrometer* and an *absolute electrometer*. The latter consists essentially of two parallel circular plates attracting one another, one of them, the upper, suspended from one arm of a balance, the other being movable to a greater or less distance from the first by means of a micrometer screw. The upper disc is always brought to a fixed position (which can be very accurately determined) by means of the attraction of the lower, the amount of attraction being regulated by the distance between the two plates. It is thus seen that the electric force is actually weighed, and formulas are given by means of which the difference of potentials is deducible in absolute measure, the areas of the plates and the distance between them being known. Professor Dewar has introduced a very delicate electrometer based on the alteration of the force of capillarity by electric action.

Electrophorus.

excited by friction, and a polished metal disc with an insulating handle. The resin disc is electrified by striking it or rubbing it with a catskin or flannel, and the metal plate is then laid upon it. In these circumstances the upper plate does not receive a direct charge

from the lower, but, if touched with the finger, receives an opposite charge by induction. On lifting it away by its insulating handle it is found to be charged, and will give a spark. It may then be replaced on the lower plate, and the process repeated an indefinite number of times without any fresh excitation if the weather is favourable.

Electroscope (ē-lek'trō-skōp), *n.* [Gr. *ēlektron*, amber (electricity), and *skopōs*, to view.] An instrument for observing or detecting the existence of free electricity, and, in general, for determining its kind. All electroscopes depend for their action on the elementary law of electric forces, that bodies similarly charged repel each other, bodies dissimilarly charged attract. The simplest electroscope consists of a pair of short pieces of straw suspended by silk threads. When

not in use the pieces of straw hang down, touching each other. On presenting an electrified body to them they become excited and stand apart, thus giving a test for electricity. This electroscope has been superseded by the *gold-leaf electroscope* of Bennet introduced in 1789. This consists of two pieces of gold-leaf, about $\frac{1}{2}$ inch broad, fixed to a brass rod and hung inside a glass globe, which has been thoroughly dried in order that the insulation of the leaves may be as perfect as possible.

The globe is closed with a wooden stopper, through the centre of which passes a glass tube containing the brass rod. The upper end of the rod is furnished with a knob. If an electrified body be brought near the top of the instrument induction takes place; the top becomes electrified oppositely to the body presented, and the gold leaves similarly. To find if the latter are positively or negatively charged we rub a glass rod and bring it near the knob; if positively charged, the leaves will diverge still more under the induction of the glass; if negatively, they will collapse by the negative being attracted to the positive of the glass rod.

The non-metallic bodies, generally known as *metalloids*, are oxygen, hydrogen, nitrogen, carbon, chlorine, bromine, iodine, fluorine, sulphur, selenium, phosphorus, boron, and silicon. Arsenic, antimony, and bismuth are also sometimes classed among the non-metals. (See METALLOID.) Berzelius classified these into *metalloids*, *halogens*, and *gazytes*. The *metalloids* comprised sulphur, phosphorus, carbon, boron, resembling the metals in some respects, but differing widely in others; the *halogens*, chlorine, iodine, bromine, fluorine, characterized by entering into peculiar and distinct saline combinations; and the *gazytes*, oxygen, hydrogen, nitrogen, then known only in the gaseous form, having never been solidified or liquefied. In this sub-classification two non-metallic bodies—selenium and silicon—do not appear. All the remaining fifty-one bodies are generally regarded as metals. (See METAL.) The elements which

constitute the great mass of the earth's crust are comparatively few, viz. aluminium, calcium, carbon, chlorine, hydrogen, magnesium, oxygen, potassium, silicon, sodium, sulphur. Many of the recently-discovered elements, as tellurium, ruthenium, thallium, cesium, rubidium, indium, &c., occur in very minute quantities, the discovery of the four last mentioned being due to spectrum analysis.

H. Burton.*

Now here again we may observe the error into which Locke was led by confounding the cause of our ideas with their occasion. There can be no idea, he argues, prior to experience; granted. En- A common adverbial or prepositional prefix in English words, from *L. in*, as *en*, *en*, or from *Gr. en*, as *enclitic*, or it simply represents the *E. in*, as *enwrap*. Words in English which contain the *Gr. en* are mostly scientific or technical terms of modern formation, though others, such as *enthusiasm*, form a portion of our everyday vocabulary. *En*, derived from the *L. in*, in many cases appears in words that have come to us through the French, though in other cases compounds with *en* are merely formed on the model of such Romance words, the Latin or English *in* assuming this form from the influence of the French. Hence, a form in *en* and one in *in* are frequently found co-existing; as, *enwrap*, *inwrap*; *engulf*, *ingulf*; *enquire*, *inquire*; with, however, a tendency in one or other of the forms to disappear, except when, as in *ensure*, *insure*, a special meaning has been assigned to each. Before labials *en* becomes *em*, as in *embellish*, *embrace*, but may remain unchanged before *n*, as *enmew* or *enmew*, *enmarble*. As a verbal prefix *en* sometimes retains its original meaning of *in*, as *engage*, *engraft*, *enfetter*; or it denotes a change from one state into another, as *enable*, *enrich*, *enslave*, *enfranchise*, *enlarge*, and hence has often the effect simply of a verb-forming prefix; sometimes it seems to have little influence on the meaning of the principal word, as in *enkindle*, *encaptivate*.

-En. A suffix of common occurrence in English words, having several origins and uses. (a) It is a verb-forming suffix (in *A. Sax. -nīan*), as in *fatten*, *freshen*, *whiten*, *sweeten*, &c. (b) It is an adjective-forming suffix from nouns signifying some kind of substance or material (common also in *A. Sax.*), and in this usage represents an old genitive, as in *golden*, *wooden*, *oaken*, &c. (c) It is also a feminine suffix, as in *vixen*; and perhaps a diminutive, as in *maiden*. (d) It was formerly a plural termination of nouns and of verbs, as *housen*, *escapen*, and is still retained in *oxen*, *children*.
